WebPlugIn Protocol Reference

(informal protocol)

Framework	/System/Library/Frameworks/WebKit.framework
Availability	Available in Mac OS X v10.3.9 and later.
Declared in	WebPlugin.h
Companion guides	WebKit Plug-In Programming Topics WebKit Objective-C Programming Guide

Overview

The `WebPlugIn` informal protocol defines methods that enable interaction between an application using the WebKit framework and any WebKit-based plug-ins it may use.

Tasks

Accessing the Scripting Environment

- [objectForWebScript](#) (page 6)
Returns an object that exposes the plug-in's scripting interface.

Using Plug-in State Information

- [webPlugInSetIsSelected:](#) (page 7)
Controls plug-in behavior based on its selection.

Controlling the Plug-in

- [webPlugInDestroy](#) (page 6)
Prepares the plug-in for deallocation.
- [webPlugInInitialize](#) (page 7)
Initializes the plug-in.
- [webPlugInStart](#) (page 7)
Tells the plug-in to start normal operation.

- [webPluginStop](#) (page 8)
Tells the plug-in to stop normal operation.

Instance Methods

objectForWebScript

Returns an object that exposes the plug-in's scripting interface.

- (id)objectForWebScript

Return Value

An object representing the plug-in's scripting interface.

Discussion

The methods of the object are exposed to the script environment. Messages sent to the returned object will be invoked in the scripting environment. See the WebScripting Protocol Reference informal protocol for more details.

Availability

Available in Mac OS X v10.3.9 and later.

Related Sample Code

QT Capture Widget

SayIt

WebKitCIPPlugin

WebKitPluginWithJavaScript

Declared In

WebPlugin.h

webPluginDestroy

Prepares the plug-in for deallocation.

- (void)webPluginDestroy

Discussion

Typically, this method releases the memory and other resources used by the plug-in. For example, if the plug-in retained a WebPluginContainer object, this method should release that object. Do not send any other messages to the plug-in after invoking this method, because calling this method destroys the plug-in. No other methods in this interface may be called after the application has called this method.

Availability

Available in Mac OS X v10.3.9 and later.

Related Sample Code

SayIt

WebKitCIPPlugin

Declared In
WebPlugIn.h

webPlugInInitialize

Initializes the plug-in.

- (void)webPlugInInitialize

Discussion

Tells the plug-in to perform one-time initialization. This method must be called only once per instance of the plug-in object, before any other methods in the protocol are called.

Availability

Available in Mac OS X v10.3.9 and later.

Related Sample Code

QT Capture Widget

SayIt

WebKitCIPlugIn

Declared In
WebPlugIn.h

webPlugInSetIsSelected:

Controls plug-in behavior based on its selection.

- (void)webPlugInSetIsSelected:(BOOL)*selected*

Parameters

isSelected

If YES, the plug-in is currently selected. Otherwise, it is not selected.

Discussion

This may be used, for example, to change the plug-in's appearance when it is selected by the user.

Availability

Available in Mac OS X v10.3.9 and later.

Declared In
WebPlugIn.h

webPlugInStart

Tells the plug-in to start normal operation.

- (void)webPlugInStart

Discussion

The plug-in usually begins its primary task (such as drawing, playing sounds, or animating) in this method. This method may be called more than once, provided that the application has already called [webPluginInitialize](#) (page 7) and that each call to this method is followed later by a call to [webPluginStop](#) (page 8).

Availability

Available in Mac OS X v10.3.9 and later.

Related Sample Code

WebKitCIPugin

Declared In

WebPlugin.h

webPluginStop

Tells the plug-in to stop normal operation.

- (void)webPluginStop

Discussion

This method may be called more than once, provided that the application has already called [webPluginInitialize](#) (page 7) and that each call to this method is preceded by a call to [webPluginStart](#) (page 7).

Availability

Available in Mac OS X v10.3.9 and later.

Related Sample Code
